### reface?

Since early in the 1970's, victimization surveys ave been carried out under the National Crime urvey (NCS) program to provide insight into the npact of crime on American society. As one of the jost ambitious efforts vet undertaken for filling ome of the gaps in crime data, the surveys, carried ut for the Law Enforcement Assistance Adinistration (LEAA) by the U.S. Bureau of the Cenis, are supplying the criminal justice community ith new information on crime and its victims, comlementing data resources already on hand for nuroses of planning, evaluation, and analysis. Based n representative sampling of households and comercial establishments, the program has had two ajor elements, a continuous national survey and parate surveys in 26 central cities across the Naon.

Based on a scientifically designed sample of housg units within each jurisdiction, the city surveys ad a twofold purpose: the assessment of public attudes about crime and related matters and the evelopment of information on the extent and sture of residents' experiences with selected forms ' criminal victimization. The attitude questions ere asked of the occupants of a random half of the ousing units selected for the victimization survey. order to avoid biasing respondents' answers to the titude questions, this part of the survey was adinistered before the victimization questions. hereas the attitude questions were asked of perns age 16 and over, the victimization survey apied to individuals age 12 and over. Because the atude questions were designed to elicit personal onions and perceptions as of the date of the interview. was not necessary to associate a particular time ame with this portion of the survey, even though me queries made reference to a period of time preding the survey. On the other hand, the victimizaon questions referred to a fixed time frame-the 12 onths preceding the month of interview-and reondents were asked to recall details concerning cir experiences as victims of one or more of the Howing crimes, whether completed or attempted: pe, personal robbery, assault, personal larceny, irglary, household larceny, and motor vehicle eft. In addition, information about burglary and bbery of businesses and certain other organizaons was gathered by means of a victimization rvey of commercial establishments, conducted parately from the household survey. A previous

publication, Criminal Victimization Surveys in Washjington, D.C. (1977), provided comprehensive coverage of results from both the household and commercial victimization surveys.

Attitudinal information presented in this report was obtained from interviews with the occupants of 4,676 housing units (8,156 residents age 16 and over), or 90.9 percent of the units eligible for interview. Results of these interviews were inflated by means of a multistage weighting procedure to produce estimates applicable to all residents age 16 and over and to demographic and social subgroups of that population. Because they derived from a survey rather than a complete census, these estimates are subject to sampling error. They also are subject to response and processing errors. The effects of sampling error or variability can be accurately determined in a carefully designed survey. In this report, analytical statements involving comparisons have met the test that the differences cited are equal to or greater than approximately two standard errors; in other words, the chances are at least 95 out of 100 that the differences did not result solely from sampling variability. Estimates based on zero or on about 10 or fewer sample cases were considered unreliable and were not used in the analysis of survey results.

The 37 data tables in Appendix I of this report are organized in a sequence that generally corresponds to the analytical discussion. Two technical appendixes and a glossary folion the data tables: Appendix II consists of a facilities of the survey questionnaire (Form NCS 6), and Appendix II supplies information on sample design and size, the custimation procedure, reliability of estimates, and significance testing; it also contains standard error tables.

### Crime and attitudes

During the 1960's, the President's Commission on Law Enforcement and Administration of Justice observed that "What America does about crime depends ultimately upon how Americans see crime. . . . The lines along which the Nation takes specific ac-

tion against crime will be those that the public helieves to be the necessary ones." Recognition of the importance of societal perceptions about crime prompted the Commission to authorize several public opinion surveys on the matter. In addition to measuring the degree of concern over crime, those and subsequent surveys provided information on a variety of related subjects, such as the manner in which fear of crime affects people's lives, circumstances engendering fear for personal safety, members of the population relatively more intimidated by or fearful of crime, and the effectiveness of criminal justice systems. Based on a sufficiently large sample, moreover, attitude surveys can provide a means for examining the influence of victimization experiences upon personal outlooks. Conducted periodically in the same area, attitude surveys distinguish fluctuations in the degree of public concern; conducted under the same procedures in different areas, they provide a basis for comparing attitudes in two or more localities. With the advent of the National Crime Survey (NCS) program, it became possible to conduct large-scale attitudinal surveys addressing these and other issues, thereby enabling individuals to participate in appraising the status of

public safety in belic communities.

Rased and after from 1974 attitudinal survey, the

lifetyles, and local police performance. Certain
stated of only one germon per household (the "household respondent"), whereas others were administered to all germons age 16 and over ("inministered to all germons age 16 and over ("ingoodens, Icaulis, were obtained for the total
measured population and for several demographic

and social subgroups.

Conceptually, the survey incorporated questions pertaining to behavior as well as opinion, Concern-

ing behavior, for example, each respondent for a household was asked where its members shopped for food and other merchandise, where they lived before moving to the present neighborhood, and how long they had lived at that address. Additional questions asked of the household respondent were designed to elicit opinions about the neighborhood in general. about the rationale for selecting that particular community and leaving the former residence, and about factors that influenced shopping practices. None of the questions asked of the household respondent raised the subject of crime. Respondents were free to enswer at will. In contrast, most of the individual attitude questions, asked of all household members age 16 and over, dealt specifically with matters relating to crime. These persons were asked for viewpoints on subjects such as crime trends in the local community and in the Nation, chances of being personally attacked or robbed, neighborhood safety during the day or at night, the impact of fear of crime on behavior, and the effectiveness of the local police. For many of these questions, response categories were predetermined and interviewers were instructed to probe for answers matching those on the questionnaire.

on the questionniste.

Although the attitude survey has provided a wealth of data, the results are opinions. For each property of the certain residents may have prevently and extending the certain residents may have prevently and extending the certain residents of the certain residents and residents and of respirations about any given issue. Neverthelase, people's opinions leibout any given issue. Neverthelase, people's opinions, belief, and perceptions about crime are important because they may influence behavior, bring about changes in certain relief.

analytical section of the report. Ingermation concerning such asperiences was gathered with separate questionniares, Forms NCS 3 and 4, used in administering the victimization component of the commission of the control of the control of the victimization of the control of the control of the which also contains a detailed description of the survey-measured criters, a discussion of the limitations of the central city surveys, and fusionities of the control of the

<sup>\*\*</sup>President's Commission on Law Enforcement and Administration of Justice, The Challenge of Crime in a Free Society, Washington, D.C.: U.S. Government Printing Office, February 1967, pp. 49-53.

crimes, whether completed or attempted, during the 12 months prior to the month of the interview were considered "victimized": rane, personal robbery. assault, and personal larceny. Similarly, members of households that experienced one or more of three types of offenses-burglary, household larceny, and motor vehicle theft-were esterorized as victims These crimes are defined in the glossary. Persons who experienced crimes other than those measured by the program, or who were victimized by any of the relevant offenses outside of the 12-month reference period, were classified as "not victimized." Limitations inherent in the victimization surveythat may have affected the accuracy of distinguishing victims from nonvictims-resulted from the problem of victim recall (the differing ability of respondents to remember crimes) and from the phenomenon of telescoping (the tendency of some respondents to recount incidents occurring outside. usually before, the appropriate time frame). Moreover, some crimes were sustained by victims outside of their city of residence; these may have had little or no effect in the formation of attitudes about local matters.

Despite the difficulties in distinguishing precisely between victims and nonvictims, it was deemed important to explore the possibility that being a victim of crime, irrespective of the level of seriousness or the frequency of occurrence, has an impact on behavior and attitudes. Adopting a simple dichotomous victimization experience variablevictimized and not victimized-for purposes of tabulation and analysis also stemmed from the desirability of attaining the highest possible degree of statistical reliability, even at the cost of using these broad categories. Ideally, the victim category should have distinguished the type or seriousness of crimes, the recency of the events, and/or the number of offenses sustained.2 Such a procedure seemingly would have yielded more refined measures of the effects of crime upon attitudes. By reducing the number of sample cases on which estimates were based, however, such a subcategorization of victims would have weakened the statistical validity of comparlsons between the victims and nonvictims.

<sup>&</sup>quot;Survey results presented in this report contain attitudinal data furnished by the victims of "series victimizations" (see glossary).

### Summary

Even though nearly half of all District of Columis residents age 15 and over indicated they had mitted or changed their activities because of rime the years preceding 1914, most other indicators uggested that the threat of criminal victimization did not strongly influence personal lifetyles or sobility. For instance, motives other than minimizing the threat of crime were paramount in actional graph of the continuous control of the control

Six in very 10 Washington residents thought that rime in the Nation was on the increase. When the interview focused on local crime, however, impretions were far different. Only in it expondents thought that critical the neighborhood crime situation as no worse than werage compared with the rest of the city, and fewer than half thought their personal chances of vicinization half increased. Nine in 10 realtens and they chiefurnization half increased. Nine in 10 realtens and they for the day, and 6 in 10 so indicated shout nighttime.

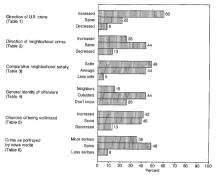

valuated police performance as at least average.

Opinions on crime-related issues were not uniform across all sectors of the city's population, however. The differential effects of the threat of victimization were particularly apparent among women, the elderly, and recent victims. Women were much more likely than men to have expressed fear of being out alone in their neighborhoods at night, to have indicated they had changed their activities because of crime, and to have thought that their chances of robbery or attack had increased. Older persons were much more likely than younger ones to have said that they were afraid to go out in their neighborhoods alone at night and that they had changed or limited their activities because of the crime threat. Differences between young and old in the evaluation of police performance also were quite apparent. Young persons were much more likely than older residents to have given the local police an overall poor performance rating. Although blacks and whites tended to agree on most survey issues, blacks were more likely than whites to have said they changed their activities because of fear of crime and to have rated police performance as less than good,

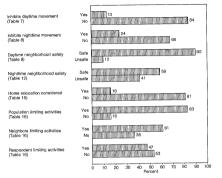

particularly in the areas of operational practices and community relations.

Nowinistanding the relatively low level of comer about the threat of crine among the general population, recent victimization experience was understanding related to some response instruction. Doubt continued to the continued of the continued to the continued t

### Crime trends

This section of the report deals with the perception of Wheshipper residents with respect to an extension of Wheshipper residents with respect to a most of the accuracy with which nevespers and retorious and the accuracy with which nevespers and retorious ower thought to be reporting the crime problem. The findings were drawn from Dara Tables 1 through 6, found in Appendix 1. The relevant questions, appearing in the facilitate of the survey instrument (Appendix II), are 59, 95, 10s, 12, 15s, and Darach questions was alted of persons age 16 and 1907 each questions was alted of persons age 16 and

### U.S. crime trends

Washington residents indicated a widespread but far from unanimous belief, at the time of the survey, that arrise had increased in the United States over the previous year or two. Some 60 percent thought that crime had gene up; fewer, about 22 precent hat crime had remained at about the same level; and the smallest proportion. Spercent, indicated that that decreased. Ten percent didn't know if there had been a trend.

### Neighborhood crime trends

In contrast, the modal (most common) response about crime trends in the neighborhood over the past year or two was that they had remained at about the same level (44 percent), although relatively more people believed that an increase (26) rather than a decrease (13) had occurred; 13 percent did not have an impression of the trend in neighborhood.

crime. Most residents (94 percent) rated their neighborhood crime problem as no worse than average in comparison to other parts of the Washington area. Contrasting with the 37 percent who believed their vicinities were less dangerous than others and the 12 percent who thought they were much less dangerous. only 5 percent suggested that their neighborhoods were more or much more dangerous. Although there were some statistically significant differences between the responses of members of different groups who considered their neighborhoods either more dangerous or much more dangerous, the magnitude of variation was quite limited. Variations among responses to the effect that neighborhoods were less dangerous also were small, except among members of the two largest racial groups. Relatively more

whites (72 percent) than blacks (39) believed their communities were less or much less dangerous, whereas blacks were much more likely (54) than whites (24) to have felt that neighborhood crime was about average.

### Who are the offenders?

The largest proportion of residents (44 percent) attributed most neighborhood crime to persons not living in the vicinity. I Spercent biamed neighboring people, and 12 percent cited both outsiders and nearby residents. More than 1 in 4, however, said hey did not know where the offenders resided.

There was some disagreement among population subgroups with regard to the place of residence of those committing neighborhood crime. A higher proportion of blacks than whites (18 vs. 10 percent) suggested neighborhood people were committing most crime, whereas whites were more likely than blacks (55 vs. 39 percent) to think that outsiders were the main perpetrators. Residents under age 35 were more likely than older ones (19 vs. 11 percent) to have blamed neighboring residents, and persons age 65 and over were the least likely of any age group to have implicated their neighbors (7 percent). Victims of crime, who might be presumed to have been more knowledgeable about the identity of offenders because of their involvement with crime, were more apt than nonvictims to have had an opinion about the residence of offenders-they identified both community people and outsiders relatively more often than did nonvictims.

### Chances of personal victimization

Respondents were also asked about their perceptions of any change in their chances of being attacked or robbed. Forty-two percent believed their chances had increased over the past year or two, and only 13 percent thought there had been a decrease. A larger proportion of recent victims (47 percent) than nonvictims (40) suggested that their chances of assault or robbery were up, and a substantially higher proportion of females (47) than of males (35) asserted that their chances of attack were up. Relative to other age groups, persons age 16-19 were the least apt to have thought that their chances of being victimized had gone up, whereas those age 20-24 were most likely to have held that belief-an unusual contrast between the responses of the two youngest groups. There was no significant difference between the overall proportion of blacks and whites

rating their chances of attack as having increased, although a nominally higher proportion of blacks believed their chances had gone down. As an additional measure of perceptions about

### Crime and the media

crime trends, respondents were asked to compare the seriousness of crime to coverage of the problem by newspapers and television. A higher proportion of persons accepted than rejected the accuracy of media interpretations of crime, although the difference was small (49 vs. 45 percent). Of those rejecting media accounts, 36 percent felt that crime was more serious and only 9 percent thought it was less serious than reported. In general, there was little meaningful opinion variation among demographic groups, although blacks, by a fairly large margin, were more likely than whites (39 vs. 30 percent) to have indicated that crime actually was more serious than portrayed by newspaper and television reporting.

Among other things, results covered then far laws shown shall many residents of the Diritor of Columbia believed crime had increased over the years leading up to the avervey, and, in addition, fast their own chances of being attacked or robbed had risan. Whether or not they feared for their protonal safety is a matter treated in this section of the report. Also considered the same of the same of the report of the far of crime on activation of the same of the

### Crime as a deterrent to mobility

Some five out of every six residents said they were not afraid of going to parts of the metropolitan area they had reason to visit during the day, compared with 66 percent who so stated about nightnine. This sustantial difference between proportions of residents who indicated they felt relatively safer during the day than at night held for each sex, rece, and age group, as well as for victims and nonvictims.<sup>1</sup>

Some groups under study were less likely than others to indicate fear of visiting parts of the metropolitan area. Compared with their counterparts, relatively fewer males, blacks, or persons not victimized expressed such fear, whether in a daytime or nighttime situation. There was, however, an inconsistency among persons distinguished by age Whereas relatively more persons age 16-34 than of those 35 and over said they were not afraid of going to parts of the metropolitan area during the day (87 vs. \$1 percent), there was less difference of opinion between the two groups with respect to nighttime fear: 69 percent of those age 34 and younger claimed not to fear such excursions, compared with 67 percent of persons in the older age range, a nominal although statistically significant difference.

### Neighborhood estety

Washingtonians reported their feelings about being out alone in their neighborhoods during the day and night by selecting one of four descriptors very safe, reasonably safe, somewhat unsafe, or very unsafe. Nine out of ten residents said they felt

It should be noted that the source questions for data covered in this section (Questions 13a and 13b) referred to places in the

reasonably or very safe out alone in their neighborhood during the day, and a majority responded in the same manner regarding night, although the proportion dropped to about 6 in 10.

pursues ortogen to about 6 in 10.

The proportions of respondents who said they felt The proportions of respondents who said they felt all proper such as the property of the

The proportion of residence who said they folt very or reasonably safe when out alone in their very or reasonably safe when out alone in their neighborhoods at night was, as previously indicated, lower than that reported for the dayline. Moreover, there was a wider response diversity among sangrough that felt very or reasonably safe when out alone in their neighborhood at night than during the day. For example, roughly 9 in 10 males age 16-19, whether white or black, felt secure at night, compared to about 3 in 10 white females age 65 and pareet on about 3 in 10 white females age 65 and

over. There were two other major differences in the distribution of responses to the questions about daytime to the contribution of supposes to the questions about daytime against time. "responses for all groups studied. Over-'very safe, "responses for all groups studied. Overaries of the contribution of the contribution of the conparted to only in precent who felt very safe. And, in the contribution of the contribution of the conparted to only in precent who felt very safe. And, in many contributions of the contribution of the conparted to the contribution of th

Age and sex were the demographic variables that

most clearly differentiated respondents who make they git secure from these who indicated they were at risk when out alone in their neighborhoods at a risk when out alone in their neighborhoods at some and they felt safe rather than unanfe. For person and they felt safe rather than unanfe. For person and get 30-64, here was no significant difference with a significant day felt ference with the safe rather than the safe of unanfeet and of the safe rather than the removable to anything the safe where the safe rather than the removable to name the high the places, those with the safe rather than the removable to name the high the places in the respondent rather than the removable to name that high the places, those than the safe of the safe than the removable than the safe of the safe than the removable to anything the places that the removable to the safe of t

ge 25-34, there was a downward trend with inreased age in the proportion of persons who said hey felt safe. Whereas three-fourths of males reported they felt

afe at night, 46 percent of females considered themelves likewise, and the response differences between nales and females held at each age level. Large proortions of both blacks and whites expressed a feelng of safety when out alone in their neighborhoods t night, and there was no significant difference beween the proportion of members of each race who elt secure. However, when specified by age, it was pparent that for both blacks and whites, the clatively high numbers of those who reported feelng safe applied only to persons under age 50, and a lear majority of members of each race over age 64 ctually said they felt insecure. Higher proportions of both victims and nonvictims said they felt safe ather than unsafe at night; and, as was true for the

mestion concerning daytime safety, there was vir-

ually no statistical difference between the propor-

# ions of nonvictims and victims who expressed a lack Crime as a cause for moving away

of security.

As another indication of the extent to which eighborhood crime caused fear, Washington repondents who had stated they felt somewhat or very insafe when out alone in the vicinity of their homes luring day or night were asked whether the eighborhood was dangerous enough for them to ensider moving elsewhere. Four out of five of those esidents said they had not, whereas 16 percent sugested that danger from crime had made them conider moving. One-fourth of persons victimized in 973 had thought of moving because of crime; elatively more blacks than whites had done so. deither sex nor age of the residents differentiated neaningfully between persons who had contemslated moving and those who had not.4

### Crime as a cause or activity modification

The final measure of the extent of crime-induced ear was developed by a battery of questions about inv perceived limitations or changes in the respond-

<sup>4</sup>As shown in Data Table 15, males appeared to be slightly nore likely than females to say they had thought about moving. The observation is somewhat misleading, however, because the ource question was asked only of persons who said they felt unafe during daytime and/or nighttime. Totaling 42 percent of the ent's activities and in those of other individuals. About 83 percent of all persons age 16 and over thought that people in general were changing their activities because of crime, and a smaller proportion, 61 percent, suggested people in their neighborhood were doing so. A third question in the series centered on the respondents personally, and the proportion of positive answers dropped even furtherto 47 percent.

More detailed examination of population subgroups revealed significant variations in proportions of those stating they personally had limited or changed their activities because of fear of crime, and one of the strongest determinants of such change was the age of the resident. Up to age 49, a majority of all respondents denied that crime was limiting or changing their activities; beyond that age, however, a majority indicated that it had done so. A general upward trend with age in crime-related changes was true for each of the four race-sex groups as well. even though statistical significance was lacking between apparent differences for a few intermediate age categories.

More than half (55 percent) of the city's females indicated changing or limiting their activities, compared to a smaller proportion of males (37). These response differences between the sexes held for each age category except the eldest one; for black males and females age 65 and over there was no significant difference between the proportions of those reporting change. For whites of that age group, however, a somewhat higher proportion of females than of males said they had revised their activities.

Overall, blacks were more likely than whites to have suggested that crime was limiting personal activity (49 vs. 42 percent). Comparing persons of onposite sex, however, this difference applied only to those age 25 and over, excluding females age 65 and over.

With regard to victims and nonvictims, there was no significant difference between the proportion of each group who indicated that fear of crime had led to activity changes.

relevant population, individuals who were asked the question included 25 percent of all males, contrasted with 54 percent of all females. Thus, 7 percent of the total population are 16 and over-including 4 percent of males and 8 percent of femalessaid they had seriously considered moving.

### Residential problems and lifestyles

The initial attitude survey questions were designed to gather information about certain specific behavioral practices of Washington, D.C., householders and to explore perceptions about a wide range of community problems, one of which was crime. As indicated in the section entitled "Crime and Attitudes," certain questions were asked of only one member of each household, known as the household respondent. Information gathered from such persons is treated in this section of the report and found in Data Tables 19 through 26; the pertinent data were based on survey questions 2a through 7b. In addition, the responses to questions 8a through 8f. relating to certain aspects of personal lifestyle, also are examined in this section; the relevant questions were asked of all household members age 16 and over, including the household respondent, and the results are displayed in Data Tables 27 through 30. As can be seen from the questionnaire, and unlike the procedure used in developing the information discussed in the two preceding sections of this report, the questions that served as a basis for the tonics covered here did not reveal to respondents that the development of data on crime was the main purpose of the survey.

### Neighborhood problems and selecting a home

Only show 3 percent of bussished respondents who had moved during the preceding who had been should be shown that the said state where interviewed enter all states of the most important reason for selecting; that the most important reason for selecting; that consider the most offer states of the said states of the s

A majority of Washingtonians (65 percent) were satisfied with their community to the extrent that they were unable to suggest features they disliked about it. Of those who indicated there were neighborhood problems, the largest proportion (37 percent) said crivironmental issues—such as Itash, noise, and overcrowding—were most important, and 19 pc-cent, the second integet proportion, singled out crime as the major difficulty. Compared with any other bayeron, respondent representing victimized beautionally obtained with the second continued to the second problems extended, and there persons were about a problem extended, and there persons were about the second problems of the second probl

# Food and merchandise shopping practices

Persons representing some 263,300 households were asked where they did their major food and general merchandise shopping. Seventy-two percent of these said they shopped for food in their neighborhood. Of the 28 percent of household respondents who indicated food shopping was done in stores outside of the community, only 3 percent cited neighborhood crime as the most important reason for doing so, and the two most often cited reasons for traveling outside of the neighborhood were the lack or inadequacy of stores. In fact, crime was the least frequently given reason for not doing food shopping in the neighborhood, and variations in subgroup responses for the crime category were too small to be meaningful. By a small margin (51 vs. 47 percent), householders usually did general merchandise shopping in suburban or neighborhood areas rather than downtown. Only 2 percent of the household respondents who usually shopped in suburban or neighborhood areas cited crime downtown as the major reason for not shopping there. The number of those who shopped downtown because of crime in the suburbs or the neighborhood was too small to yield a statistically reliable estimate. Convenience was the overriding motive behind location preferences for general merchandise shopping.

## Entertainment practices

All respondents age 16 and over were asked about the frequency with which they went out for entertainment and the location they generally chose, either in or outside the city. A majority of persons (52 percent) stated they were going out for entertainment about as much as in the past year or two, hereas 31 percent suggested they were going out as often and 14 percent more frequently. For those porting reduced entertainment activity outside the ome, crime ranked as one of three most often menoned primary reasons; in fact, there was no signifiant difference between the proportion of persons ho selected crime and those who gave personal fiances or family arrangements as the main cause. ersonal characteristics or victim experience apeared to bear little if any relationship to the desigation of crime as the major reason for going out ss. There was an obvious difference, however, be-

veen persons under 35 and older ones. Only about percent of the younger age group cited crime as the

pajor reason for reduced entertainment activity. ompared with 1 in 4 persons 35 years and over.

A large majority of residents, 3 out of 4, said they sually stayed in the city for entertainment, and 16

ercent stated they left the city about as often as they emained in it. For the 8 percent of city residents ho chose suburban areas, the most readily offered

easons were a preference for facilities and convenince. Crime was cited as the paramount reason for ot seeking entertainment in the city by about 14 ercent of this group. The apparently large proporon of persons age 65 and over (24 percent) who

aid they relied on suburban entertainment facilities ecause of their fear of city crime did not differ sigificantly from the percentages for most other age roups.

# Local police performance

Following the series of questions concerning neighborhood safety and crime as deterrent to personal mobility, individuals age 16 and over were asked to assess the overall performance of the local police and to suagest ways, if any, in which police effectiveness might be improved. Data Tables 31 through 37, derived from survey questions 14n and 14b, contain the results on which this discussion is based.

# Are they doing a good, average, or poor job?

(46 percent) evaluated police performance as werage, the second largest thought it was good (35), and only 12 percent said it was poor; 8 percent declined to comment. There was virtually no difference between ratings by males and females, and victims disagreed with nonvictims only in assigning a poor rating—15 percent of victims sugsessed police were doing a poor job, whereas 11 percent of the nonvictims thought to.

The largest proportion of Washington residents

The city's two largest racial groups, however, clearly differed in their evaluation. Whites were about twice as likely as blacks to rate police performance as good (34 vs. 26 percent), likely proportions of blacks having angested the police were obtained as the policy of the policy

Evolusions given by resident classified account, not one and now were reliabled. Other residents were reliabled properties of the properti

Blacks age 16-34, whether male or female, were the individuals most likely to say the police were doing a poor job. About 20 percent of these persons gave poor ratings, compared to only about 5 percent for their white counterparts.

### How can the police improve?

Retidents were nixed to suggest ways in which the police could improve their performance, and about all prexent of the population had specific auggested and according to the population had specific auggestions for improvement were purposition of suggestions for interest and community relations. The remainder of the responses were nearly quality divided between matter related to present contracts and community relations. If the properties of the properties of

Keeping in mind differences in the way the various groups under study assessed police performance, it is of interest to examine how opinions contrasted regarding ways to improve the police. Whites suggested improving personnel resources proportionally more than blacks (26 vs. 17 percent), whereas the latter were more likely to indicate that operational practices and community relations should be appraded. The preference for improved personnel resources by whites as opposed to blacks tended to apply irrespective of age, although not all of the apparent differences between age groups were significant. However, the higher degree of interest among blacks in improved operational practices centered on persons 35 and over. The relative difference between blacks and whites desiring better community relations was maintained at each age level, and the contrast was especially marked among young males; 38 percent of black males age 16-24 indicated community relations could be improved, compared with only 13 percent of white males of that age group.

The relative number of respondents calling for improved personnel resources rose with the age of the respondent from 15 percent for 16-19 year-olds

3For most of this discussion, the eight specific response items

For most of this discussion, the sight specific regions it into some discussion in the wave combined into three extegories, as follows: community obstation; (1). The more contratous, improve contratous, community obstation; (2). "Don't discreminate." Operational resolution; (3). "Ober discreminate." Operational resolution; (4). "Ober discreminate." Operations of the contratous discreminates. Operation of the contratous discreminates discreminates discreminates discreminates. Operation of the contratous discreminates discreminates discreminates. Operation of the contratous discreminates discre

to 29 percent for persons age 65 and over, although one all apparent increases for intermediate age groups were significant. In contrast, the frequency of recommendations for improved community relations diminished from a high of 29 percent for the value of the contrast, the properties of the delote, although bere again not all step-by-step decreases used and the contrast of the

Relatively more females than males (59 vs. 53 percent) suggested improving police operations, whereas a slightly higher proportion of males than females (23 vs. 19 percent) believed better community relations were needed. Oncorning personnel resources, the response rates for men and women did not differ significantly.

Victimization experience had little apparent effect over opinions about ways of improving the police. For example, there was no significant difference between the relative frequency with which victims and nonvictims cited the need for an instance of the promote situation. And, victims were only slightly more inclined than nonvictims to indicate a need for the police to improve their relations with the public.

### Appendix I

### Survey data tables

The 37 statistical data tables in this appendix prices are the results of the Washington attitudinal survoconducted early in 1974. They are organize totopically, generally paralleling the report's snatyle, and discussion. For each subject, the data tables consist of cross-abulations of personal (or household characteristics and the relevant response categorier for a given population group, each table displayed the percent distribution of answers to a question.

All statistical data generated by the survey as

certainst state very in their degree of restability as see subject to variance, or errors, associated wit the fact that they were derived from a sample surverather than a complete counteration. Constraints of interpretation and other uses of the data, as well a guidelines for determining their entitlelity, are see forth in Appendix III. As a general rule, however port of the properties of the properties of properties. The properties of the constraints of muses, qualified by footnotes to the data tables, see out used for analytical purposes in this report.

Each date table parenthetically displays the size of the group for which a distribution of respons was calculated. As with the percentages, these bas figures are estimates. On tables showing the answer of individual respondents (Tables 1–18 an 27–37), the figures reflect an adjustment based on an independent post-Census estimate of the city' resident population. For data from household respondents (Tables 19–26), the bases were generate solely by the survey isself.

A note beneath each data table identifies the question that served as source of the data. As an execu-

thereby enabling a respondent to furnish more than single answer, the data tables reflect only the answe designated by the respondent as being the most important one rather than all answers given.

The first six data tables were used in preparin the "Crime Trends" section of the report, Table 7-18 relate to the topic "Feer of Crime"; Table 19-30 cover "Residential Problems and Lifestyles' and the last seven tables display information concerning "Local Police Performance."

### Survey instrument

Appendix II

Form NCS 6, the attitude survey instrument, comtains two batteries of quations. The first of these, covering items 1 through 7, was used to clicil data from a knowledgeable solid member of each household (Ce., the household responders). Description of the control of the description of the control of the control of the visitinization component of the survey, there was no provision for proy response on behalf of individuals who were absent or incapacitated during dividuals who were absent or incapacitated during

Data on the characteristics of those interviewed, as well as details concerning any experiences as vicinian of the measured crimes, were gathered with separate instruments, forms NCS and Act, which were administered immediately after NCS 6. Following is a facilistic of the latter questionnaire supplemental forms were available for use in bourblodd where one than three persons were incremental to the control bear three more than three persons were incremental to the control bears in calculated in this report, but can be found in Criminal Vicinitization Surveys in Washington, 100 Criminal Vicinitization Surveys i

### Technical information and reliability of the estimates

Survey results contained in this publication are board on data gashroot during surl. 1974 from pre-board on data gashroot during surl. 1974 from pre-board on data gashroot during surl. 1974 from pre-board on the city miss of Washington D.C., including loss living in certain types of group quarters, such as domittories, cooming houses, and religious group dwellings. Nonresidents of the city, including touries and communers, did not full within merchant vessels. Armed Forces personnel living in military barracks, and institutionalized persons, such as correctional fieldly instants, were not under consideration. With these expections, all persons age

Each interviewar's first contest with a unit selected for the survey was in person, and, if it were not possible to secure interviews with all eligible to secure interviews with all eligible traviews by telephone were permittable thereafter, the property of the processed and weighted, yielding results representative both of the weighted, yielding results representative both of the city's population as whole and of various sectors within the population. Because they are based on a the population. Because they are based on a because the property of the property of the property of the because they are based on a such case of the population.

### Sample design and size

Estimates from the survey are based on data obtained from a stratified sample. The basic frame from which the attitude sample was drawn-the city's complete housing inventory, as determined by the 1970 Census of Population and Housing-was the same as that for the victimization survey. A determination was made that a sample roughly half the size of the victimization sample would yield enough attitudinal data on which to base reliable estimates. For the purpose of selecting the victimization sample, the city's housing units were distributed among 105 strata on the basis of various characteristics. Occupied units, which comprised the majority, were grouped into 100 strata defined by a combination of the following characteristics: type of tenure (owned or rented); number of household members (five categories); household income (five categories); and race of head of household (white or other than white). Housing units vacant at the time of the Census were assigned to an additional four strata, where they were distributed on the basis of rental or property value. A single stratum incorporated aroun quarters.

To account for units built after the 1970 Census, a sample was drawn, by means of an independent clerical operation, of permits issued for the construction of residential housing within the city. This enabled the proper representation in the survey of other properties beginning that the first proper representation in the survey of

persons occupying housing built after 1970. In order to develop the half sample required for the attitude survey, each unit was randomly assigned to 1 of 12 panels, with units in the first 6 panels being designated for the attitude survey. This procedure resulted in the selection of 5,862 housing units. During the survey period, 717 of these units were found to be vacant, demolished, converted to nonresidential use, temporarily occupied by nonresidents, or otherwise ineligible for both the victimization and attitude surveys. At an additional 469 units visited by interviewers it was impossible to conduct interviews because the occupants could not be reached after repeated calls, did not wish to participate in the survey, or were unavailable for other reasons. Therefore, interviews were taken with the occupants of 4.676 housing units, and the rate of participation among units qualified for interviewing was 90.9 percent. Participating units were occupied by a total of 8,484 persons age 16 and over, or an average of 1.8 residents of the relevant ages per unit. Interviews were conducted with 8,156 of these persons, resulting in a response rate of 96.1 percent among eligible residents.

adjustment to account for situations where a clear not be not all college persons in a boustied persons in a boustied were instructived; (4) a boustied of southerd water instructived; (4) a boustied of southerd or particular to the person of the person o

The household ratio estimation procedure (sep 3) schieved as light reduction in the extent of sampling variability, thereby reducing the navign of the price of the thousehold survey results. It also compensated for the exclusion from each stratum of any observable survey of included in amplies for certain other Crasus Bureau programs. The household ratio and the Crasus Bureau programs. The household ratio and the contraction of any object of the contraction of any object of the contraction of the contr

The ratio cutimation factor, second element of the final weight, was an adjustment for bringing data from the attitude survey (which, as indicated, was based on a half sample) into accord with duta from the victimization survey (based on the whole sample). This adjustment, required because the attitude sample was randomly constructed from the victimization sample, was used for the age, sex, and race characteristics of respondentiation of respondentiations.

### Reliability of estimates

As previously noted, survey results contained in this report are estimates. Despite the presentations taken to minimize sampling variability, the estimates are subjects to cross raining from the fact that the sample employed was only one of a large number of used applying the same sample design and selection procedures. Estimates derived from different samples may vary somewhat; they also may differ from figures developed from the average of all possible amplet, seen if the surveys aree dismiliated works.

The standard error of a survey estimate is a measure of the variation among estimates from all possible samples and is, therefore, a gauge of the precision with which the estimate from a particular sample approximates the average result of all possible samples. The estimate and its associated standard error may be used to construct a confidence interval, that is, an interval having a prescribed probability that it would include the average result of all possible samples. The average value of all possible samples may or may not be contained in any particular computed interval. However, the chances are about 68 out of 100 that a survey-derived estimate would differ from the average result of all possible samples by less than one standard error. Similarly, the chances are about 90 out of 100 that the difference would be less than 1.6 times the standard error; about 95 out of 100 that the difference would be 2.0 times the standard error; and 99 out of 100 chances that it would be less than 2.5 times the standard error. The 68 percent confidence interval is defined as the range of values given by the estimate minus the standard error and the estimate plus the standard error; the chances are 68 in 100 that the average value of all possible samples would fall within that range. Similarly, the 95 percent confidence interval is defined as the estimate plus or minus two standard errors.

In addition to sampling error, the estimates presented in this report are subject to nonsampling error, chiefly affecting the accuracy of the distinction between victims and nonvictims. A major source of nonsampling error is related to the ability of respondents to recall whether or not they were victimized during the 12 months prior to the time of interview. Research on recall indicates that the ability to remember a crime varies with the time interval between victimization and interview, the type of crime, and, perhaps, the socio-demographic characteristics of the respondent. Taken together, recall problems may result in an understatement of the "true" number of victimized persons and households as defined for the purpose of this report. Another source of nonsampling error pertaining to victimization experience involves telescoping, or bringing within the appropriate 12-month reference period victimizations that occurred before or after the close of the period.

Although the problems of recall and telescopingprobably weakened the differentiation between cytims and nonvictims, these would not have affected the data on personal attitudes or behavior. Nevertheless, such data may have been affected by nonsampling errors resulting from incomplete or roncour responses, systematic mistakes introduced by interviewers, and improper coding and processing of data. Many of these errors also would occur in a complete census. Quality control messures, such as complete census. Quality control messures, such as a well as edit procedures in the field and at the clicical and computer processing stages, were utilized to keep such errors at an acceptably low travel and the computer processing stages, were viewed to the computer processing stages, were level. As calculated for this survey, the standard errors partially measure only those random nonsampling errors arising from response and interviewer plants of the control of t

systematic biases in the data. Regarding the reliability of data, it should be noted that estimates based on zero or on about 10 or fewer sample cases have been considered unreliable. Such estimates are identified in fortonese to the data tables and were not used for purposes of analysis in this report. For Washington, a minimum weighted estimates of 500 was considered statistically reliable, as was not purentage based on Juda a figure.

### Computation and application

### of the standard error

For survey estimates relevant to other the individual or household respondents, unlander errors simplyed on tables at the end of this approfits can improve the control of the control of the control of the rors are approximations and suggests an order of magnitude of the standard error rather than the precise error suscistants. Table 1 to information. Table 1 to information from individual respondents and T as to information from individual respondents and T as the survey of the control of the

To illustrate the application of standard errors in measuring sampling variability, Data Table 1 in this report shows that 59.8 percent of all Washington residents age 16 and over (532,800 persons) believed crime in the United States had increased. Two-way linear interpolation of data listed in Table I would yield a standard error of about 0.5 percent. Consequently, chances are 68 out of 100 that the estimated percentage of 59.8 would be within 0.5 percentage points of the average result from all possible samples; i.e., the 68 percent confidence interval associated with the estimate would be from 59.3 to 60.3. Furthermore, the chances are 95 out of 100 that the estimated percentage would be roughly within 1.0 percentage point of the average for all samples: i.e., the 95 percent confidence interval would be about 58.8 to 60.8 percent. Standard errors associated with data from household respondents are calculated in the same manner, using Table

In comparing two sample estimates, the standard error of the difference between the two figures is approximately equal to the square root of the sum of the squares of the standard errors of each estimate considered separately. As an example, Data Table 12 shows that 25.2 percent of males and 9.0 percent of females felt very safe when out alone in the neighborhood at night, a difference of 16.2 percentage points. The standard error for each estimate, determined by interpolation, was about 0.9 (males) and 0.5 (females). Using the formula described previously, the standard error of the difference between 25.2 and 9.0 percent is expressed as  $\sqrt{(0.9)^2 + (0.5)^2}$ , which equals approximately 1.0. Thus, the confidence interval at one standard error around the difference of 16.2 would be from 15.2 to 17.2 (16.2 plus or minus 1.0) and at two standard errors from 14.2 to 18.2. The ratio of a difference to its standard error defines a value that can be equated to a level of significance. For example, a ratio of about 2.0 (or more) denotes that the difference is significant at the 95 percent confidence level (or higher); u ratio ranging between about 1.6 and 2.0 indicates that the difference is significant at a confidence level between 90 and 95 percent; and a ratio of less than about 1.6 defines a level of confidence below 90 percent. In the above example, the ratio of the difference (16.2) to the standard error (1.0) is equal to 16.2, a figure well above the 2.0 minimum level of confidence applied in this report. Thus, it was concluded that the difference between the two proportions was statistically significant. For data gathered from household respondents, the significance of differences between two sample estimates is tested by the same procedure, using standard errors in Table

### Glossary

- Age—The appropriate age category is determined by each respondent's age as of the last day of the month preceding the interview.
- Annual family income—Includes the income of the household head and all other related persons residing in the same household unit. Covers the 12 months preceding the interview and includes wages, salaries, net income from business or farm, pensions, interest, dividends, rent, and any other form of monetary income. The income of persons unrelated to the head of household is excluded.
- Assault—An unlawful physical attack, whether aggravated or simple, upon a person. Includes attempted assaults with or without a weapon. Excludes rape and attempted rape, as well as attacks involving theft or attempted theft, which are classified as robbery.
- Burglary—Unlawful or forcible entry of a residence, usually, but not necessarily, attended by theft. Includes attempted forcible entry.
- Central city—The largest city of a standard metropolitan statistical area (SMSA). Community relations—Refers to question 14b (ways
- of improving police performance) and includes two response categories: "Be more courteous, improve attitude, community relations" and "Don't discriminate." Downtown shopping area—The central shopping
- district of the city where the respondent lives. Evening entertainment—Refers to entertainment available in public places, such as restaurants, theaters, bowling alleys, nightclubs, bars, ice
- theaters, bowling alleys, nightclubs, bars, iec cream parlors, etc. Excludes club meetings, shopping, and social visits to the homes of relatives or acquaintances. General merchandise shopping—Refers to shopping
- General merchandise shopping—Reters to shopping for goods other than food, such as clothing, furniture, housewares, etc.
- Head of household—For classification purposes, only one individual per household can be the head person. In husband-wife households, the husband arbitrarily is considered to be the head, in other households, the head person is the individual so regarded by its members; generally, that person is the chief breadwiner.
- Household—Consists of the occupants of separate living quarters meeting either of the following criteria: (1) Persons, whether present or temporarily absent, whose usual place of residence

- is the housing unit in question, or (2) Persons staying in the housing unit who have no usual place of residence elsewhere.
- Household attitude questions—Items I through 7 of Form NCS 6. For households that consist of more than one member, the questions apply to the entire household.
- Household larceny—Theft or attempted theft of property or cash from a residence or its immediate vicinity. Forcible entry, attempted forcible
- entry, or unlawful entry are not involved.

  Household respondent—A knowledgeable adult member of the household, most frequently the head of household or that person's spouse. For each household, such a person answers the
- "household attitude questions."
  Individual attitude questions—Items 8 through 16
  of Form NCS 6. The questions apply to each
  person, not the entire household.
- person, not the entire nousenoid.
  Individual respondent—Each person age 16 and
  over, including the household respondent, who
  participates in the survey. All such persons
  answer the "individual attitude questions."
- Local police—The police force in the city where the respondent lives at the time of the interview.

  Major food shopping—Refers to shopping for the bulk of the household's exceries.
- Measured crimes—For the purpose of this report, the offenses are rape, personal robbery, assault, personal larceny, burglary, household larceny, and motor vehicle theft, as determined by the victimization component of the survey. Include both completed and attempted acts that occurred during the 12 months prior to the month of interview.
- Motor vehicle theft.—Stealing or unauthorized taking of a motor vehicle, including attempts at such acts. Motor vehicles include automobiles, trucks, motorcycles, and any other motorized vehicles legally allowed on public roads and highways.
- Neighborhood—The general vicinity of the respondent's dwelling. The boundaries of a neighborhood define an area with which the respondent identifies.
- Nonvictim—See "Not victimized," below.

  Not victimized—For the purpose of this report, per-
- sons not categorized as "victimized" (see below)
  are considered "not victimized."

  Offender—The perpetrator of a crime.
- Offender—The perpetrator of a crime.

  Operational practices—Refers to question 14b (ways of improving police performance) and includes four response categories: "Concentrate on more

important duties, serious crime, etc."; "Be more prompt, responsive, alert"; "Need more traffic control"; and "Need more policemen of particular type (foot, car) in certain areas or at certain times."

times."

Personal larceny—Theft or attempted theft of property or cash, either with contact (but without force or threat of force) or without direct contact between victim and offender.

Personnel resources—Refers to question 14b (ways of improving police performance) and includes two response categories: "Hire more policemen" and "Improve training, raise qualifications or pay, recruitment policies,"

Race—Determined by the interviewer upon observation, and asked only about persons not related to the head of household who were not present at the time of interview. The racial categories distinguished are white, black, and other. The category "other" consists maialy of American

category orient consists mainly of American Indians and/or persons of Asian ancestry. Rape—Carnal knowledge through the use of force or the threat of force, including attempts. Statutory rape (without force) is excluded. In-

Statutory rape (without force) is excluded. Includes both heterosexual and homosexual rape. Rate of victimization—See "Victimization rate," below.

Robbery—Theft or attempted theft, directly from a person, of property or each by force or threat of force, with or without a weapon.

Series victimizations—Three or more criminal events atmilar, if not identical, in nature and incurred by a person unable to identify separately the details of each act, or, in some cases, to recount accurately the total number of such acts. The term is applicable to each of the crimes measured by the victimization component of the survey.

Suburban or neighborhood shopping areas—Shopping centers or districts either outside the city limits or in outlying areas of the city near the

respondent's residence.
Victim—See "Victimized," below.

Victimization—A specific criminal act as it affects a single victim, whether a person or household. In criminal acts against persons, the number of victimizations is determined by the number of victims of such acts. Each criminal act against a household is assumed to involve a single victim, the affected household.

Victimization rate.—For crimes against persons, the victimization rate, a measure of occurrence among population groups at risk, is computed on the basis of the number of victimizations per 1,000 resident population age 12 and over. For crimes against households, victimization rates are calculated on the basis of the number of victimizations per 1,000 households.

Victimized—For the purpose of this report, persons are regarded as "victimized" if they meet either of two criterias (1) They personally experienced one or more of the following criminal victimizations during the 12 months prior to the month of interview: rape, personal robbey, assault, or personal larceny. Or, (2) they are members of a household that experienced one or more of the following criminal victimizations during the same time frame; burglary, bousehold larceny.

or motor vehicle theft
